

FROM GENERICS TO INNOVATION

From its worst loss of ₹1,510 crore in FY22, Lupin swung to record profits of ₹3,306 crore in FY25

RESPIRATORY

Multiple products in the US, Europe, Canada. Largest therapy area

COMPLEX INJECTABLES

LAI Risperidone approved by US FDA in FY26. Multiple platform approvals validated in FY25

RANIBIZUMAB (EYE DISEASE)

US launch targeted FY27

VISUFARMA
Branded eye care portfolio, Europe

GLP-1 ANTI-OBESITY

Licensing deal signed in December 2025 with Gan & Lee Pharmaceuticals

AFLIBERCEPT (EYE/DIABETIC RETINA)

US launch expected FY29-30

BIOLOGICS

First US FDA approval received. Products already approved in Europe, Japan, Canada, Russia, Asia Pacific, LATAM & Africa

structure that plays to both their strengths and reflects the company's two-market focus. Both grew up watching DBG build Lupin from a single-product company into a global generics player, and both carry that into every strategic decision.

Vinita says DBG's dream was to take Lupin to the US, and this was inculcated in her at a very early age, when she started taking trips with her father whenever he went abroad. These learnings have stood with her over time. "I have learnt this business from my father," Vinita had once explained. "Talking to him at the dining table since I was young. He has taken me to many business meetings across Europe since I was fourteen."

Vinita describes the portfolio evolution as a decade-long capability building exercise that is now

beginning to show commercial results. "Over the last decade we have built capabilities in complex areas such as respiratory, biologics, and complex injectables," she says. "We are also making moves in innovation, including through our ophthalmology acquisition in Europe, which gives us a starting point to build further in that therapy area."

That acquisition was VISUFARMA, a pan-European specialty eye care company with a portfolio of branded products covering conditions ranging from dry eye and glaucoma to retinal disease, which Lupin acquired in September 2025 for €190 million. The investment in capability building shows up in the R&D numbers too. In FY25, Lupin spent ₹1,767 crore on R&D, roughly 8% of sales, up from ₹1,527 crore the previous year.

Respiratory has emerged as the

most visible proof of this strategy. Lupin now has multiple products approved and launched in the US, Europe and Canada, making it the company's largest therapy area. Building a respiratory business requires deep investment in device engineering, inhalation science and regulatory expertise, precisely the kind of capability that creates durable competitive advantage rather than temporary margin.

On biologics, the progress has been gradual but is now reaching a commercial phase. "On the biologics front we have approvals in Europe and Japan, and we recently received our first US FDA approval," Vinita says. "We have a strong pipeline and expect to launch several products over the next five years across key global markets."

Complex injectables are emerging as a third pillar alongside res-
