

“We have been steadily improving our performance over the last several quarters. This is on the back of several new product launches in the US and other geographies”

RAMESH SWAMINATHAN
EXECUTIVE DIRECTOR AND GLOBAL CHIEF
FINANCIAL OFFICER, LUPIN LTD

THE INDIA BUSINESS HAS GROWN CONSISTENTLY FASTER THAN THE OVERALL MARKET, WITH ABOUT TWO-THIRD REVENUE COMING FROM CHRONIC THERAPIES

piratory and biologics. “We have made significant progress in complex injectables. Over the last year, we have validated several platforms through regulatory approvals and product launches,” Vinita says. Quality and compliance, Vinita adds, are foundational. “We regularly review learnings from regulatory inspections and strengthen our systems accordingly.”

BACK IN THE NUMBERS GAME

In FY25, Lupin reported its highest profit after tax in several years, with gross sales and margins both up from the lows of FY22. “We have been steadily improving our

performance over the last several quarters,” says Swaminathan. “This is on the back of several new product launches in the US and other geographies.”

Gross sales reached ₹22,192 crore in FY25, the balance sheet moved to a net cash position, and profitability has been sustained across consecutive quarters. In FY25, Lupin was the sixth largest pharmaceutical company in India by total income. By market share, it ranks eighth, according to data from IQVIA.

The stock has moved in line with the improved results. From around ₹850 in 2017, Lupin’s share price climbed above ₹2,100 apiece by ear-

ly 2026, hitting a peak near ₹2,400 in 2025 before settling near ₹2,200, delivering a cumulative return of roughly 150% for long-term investors. Its market capitalisation stood at ₹1.6 lakh crore as on April 20.

The margin recovery has not gone unnoticed. Motilal Oswal analyst Tushar Manudhane says Lupin delivered “its highest-ever quarterly Ebitda margin in the past 10 years,” though he cautions that “competition in certain products and some gestation period for commercialisation of complex product pipeline in inhalation, injectables and biosimilar space could limit earnings growth over FY26-28.”

“What gives us confidence today is that we have seen this story before,” Nilesh says. “When you go back to the early stories of Lupin, there were many times when the question was whether the company would even exist or not. We do not have that anymore. We have a certain level of business that is robust and growing. Now the question is how we can grow faster.”

THE RIVALS WHO GOT THERE FIRST

Lupin’s performance over the past two years is best seen in comparison with how its peers navigated the same cycle.

Sun Pharma, the leader, moved early into specialty and US branded generics, reducing its reliance on commodity pricing. Dr Reddy’s focused on complex chemistry and biosimilars, Cipla on chronic therapies and selective complex launches, while Zydus strengthened its domestic branded portfolio alongside a novel pipeline.

“While pricing erosion in the US generics market has weighed on margins across the sector, the companies that have performed better are those that moved earlier
