towards higher-value products,” Vinita says.

Lupin’s strategy aligns with that approach, with the focus now on execution pace and translating its innovation push into scale. The valuation gap tells its own story. Lupin’s market capitalisation of compares with Sun Pharma’s approximately ₹4 lakh crore. It also trails Dr Reddy’s and Cipla on market value. Despite the improvement in operating metrics, investors have yet to close the gap, a signal that the market is waiting for the innovation ambition to show up in sustained earnings.

A significant part of Lupin’s recent US performance stems from

exclusivity on three products: Tolvaptan, a drug for kidney disease; Mirabegron, used to treat bladder conditions; and Spiriva, a lung therapy. These first-to-file exclusivities delivered higher margins during their protected windows. More recently, Lupin received US FDA approval in September 2025 for Lenalidomide, a generic version of Bristol Myers Squibb’s blockbuster cancer drug Revlimid, used to treat multiple myeloma, a blood cancer that affects plasma cells in the bone marrow. The branded version had estimated annual US sales of \$7.5 billion, making it one of the most significant generic approvals in Lupin’s history. As exclusiv-

ity windows close and new ones open, sustaining US revenues will depend on whether the complex generics and biosimilar pipeline can keep filling the gap.

Analysts note that sustaining the momentum will require careful execution. ICICI Securities analyst Abdulkader Puranwala says, “Dependency on US exclusivity is rising,” and that the injectable and biosimilar pipeline “may cumulatively not suffice to fill in the gap of revenue and earnings of these exclusive products.” He adds that “management believes that its US sales will likely sustain at \$1 billion after loss of exclusivities in the three products.”
