Mr Thomas Kurian, CEO, Google Cloud (left) and Mr Gautam Adani, Chairman, Adani Group.

From left: Andhra Pradesh Chief Minister Shri N Chandrababu Naidu; Union IT Minister Shri Ashwini Vaishnaw; Mr Jeet Adani, Director, Adani Group; Andhra Pradesh IT Minister Shri Nara Lokesh and Union Civil Aviation Minister Shri Kinjarapu Rammohan Naidu in Visakhapatnam on April 28.

Building at Scale

- From approvals to groundbreaking, the project has moved with unprecedented speed, reflecting a broader shift in how India is approaching infrastructure.
- The AI race will be shaped by the ability to build at scale and deliver reliably.
- The Adani Group's \$100 billion investment programme across energy, logistics, digital networks and data centres, to be deployed over the next decade, is aligned with this approach. Infrastructure is not a support layer. It is the foundation.

With undersea cable landing infrastructure and proximity to global data routes, the city is positioning itself within the flow of global data traffic. Moving beyond connectivity, it is set to usher in latency, speed and the ability to process AI workloads efficiently at scale.

In the AI economy, how data moves is as critical as how it is created.

Visakhapatnam brings together key advantages: port-led infrastructure, land availability, policy support and the ability to integrate energy and connectivity in one location. This convergence is drawing long-term investment.

The Andhra Pradesh government's push has been central to this pivot. Faster approvals and coordinated execution have compressed timelines that typically stretched over years. As

From Bharat AI to Inclusive Access

- India's AI ambition is increasingly centred on access. Not only building models, but expanding their reach.
- "When energy becomes more affordable and increasingly powered by clean sources, intelligence becomes more accessible," Mr Adani said.
- This idea underpins what is being described as Bharat

AI, where AI extends beyond large enterprises.

- Lower-cost AI can accelerate research, improve healthcare delivery, enhance agricultural productivity and expand digital services. For businesses, it opens new pathways to scale. For citizens, it expands access to intelligence.

Mr Adani noted, under Andhra Chief Minister N. Chandrababu Naidu's leadership in his 2.0 phase, the ability to move from vision to decision and from decision to delivery, has set the pace for projects of this scale.

The Energy Equation

If infrastructure is the foundation of AI, energy is its core. AI workloads are power-intensive with training models, running inference and scaling applications depending on electricity. Energy is also a major component in the cost of compute.

"The cost of intelligence is the cost of power," Mr Adani said.

This is where the Adani Group is positioning itself. Through AdaniConneX, the Group is building the physical

layer of India's AI economy, spanning data centres, transmission and clean energy integration.

The strategy is integrated. Generate power, deliver it efficiently and use it to run compute infrastructure at scale.

The Next Phase

The India AI hub in Visakhapatnam is still at an early stage. But its direction is clear. It signals a shift from fragmented capacity to concentrated scale.

If Bengaluru defined India's software era, Visakhapatnam is positioning itself to anchor the infrastructure layer of India's AI future and the message is simple: Future of intelligence will be shaped by those who build the systems that power it.
