

THE SMALLEST PART OF INDIA'S BIGGEST BUILDINGS WAS BEING IMPORTED

TWO BROTHERS FROM KASHMIR DECIDED TO CHANGE THAT.

Pankaj and Vipin Lidoo founded Landmark Crafts in 1999 with a simple but commercially audacious conviction: that India's infrastructure boom deserved Indian fasteners. Twenty-six years later, HP screws are holding the country together.

Consider the screw. It is the smallest component in almost every assembled structure India builds—the pre-engineered building rising on the outskirts of an industrial town, the metro station ceiling panel, and the commercial rooftop whose color-coated sheet profiles must hold against wind and rain for decades. The screw is invisible in the finished structure. It is foundational to whether that structure stands.

In the mid-1990s, when India's infrastructure ambition began its first serious acceleration, every self-drilling screw that went into those structures was imported. Mostly from Taiwan. At prices that reflected the absence of domestic competition and the indifference of domestic manufacturers to a product category that seemed, on the surface, too small to matter.

Pankaj Lidoo and his brother Vipin Lidoo, two brothers from Kashmir building a business in Delhi's industrial landscape, saw it differently. They saw a gap so large and so consequential that the question was not whether to enter it but how fast to move.

They began by importing. The screws came from Taiwan. The knowledge of how to make them came from that

Taiwanese association, absorbed over three to four years with the deliberate patience of entrepreneurs who understood that technology transfer, done properly, is more valuable than the product it initially produces. When they had learned enough, they invested in the machinery, set up manufacturing in Ghaziabad, and began making HP Self Drilling Screws in India at a quality level and price point that the import-dependent market had not seen before.

"It gives us immense satisfaction," Pankaj Lidoo has said, "to be seen as a home-grown company contributing to the development of India's infra and real estate projects with our portfolio of world-class screws and fasteners."

That satisfaction is now measured in a national footprint spanning manufacturing facilities in Ghaziabad and Panchkula, 14 branch offices across India, 221 employees, and a product portfolio that has grown from self-drilling screws to HP Aluminium

Blind Rivets and Dry Wall Screws under the Screwmaster brand and a full infrastructure tools vertical—making Landmark Crafts a one-stop hub for the fastening and tooling requirements of India's construction, fabrication, and infrastructure sectors. Metro projects. Commercial developments. Industrial facilities. Pre-engineered buildings. Wherever India is being assembled, HP fasteners are in the structure.

"We believe that Landmark is a thorough example of Made in India startups," the Lidoo brothers have said, "reinvesting our earnings into our country towards building an Atmanirbhar Bharat."

From Taiwan import dependency to India's largest HP self-drilling screw manufacturer—the Landmark Crafts story is what import substitution looks like when driven not by policy directive but by entrepreneurial conviction.

The screw is small. The story behind it is anything but.
