

From your vantage point, has technology adoption among Indian farmers reached a meaningful inflection point?

Indian agriculture is in the midst of a significant digital transformation.

Smartphone penetration, affordable mobile data, digital public infrastructure and increasing awareness among farmers are accelerating technology adoption. Government initiatives such as AgriStack have already enabled the creation of over 84 million farmer IDs, while Digital Crop Survey has expanded to cover more than 285 million plots, creating an important foundation for data-driven agriculture.

At the same time, adoption is becoming more visible on the ground. Industry estimates suggest that 60-70% of smallholders already receive weather and pest-related information through digital channels, while AI-driven advisories are beginning to gain traction in several farming systems.

At Godrej Agrovet, we are witnessing this shift firsthand through our engagement with farmers across crop care and oil palm businesses. The next decade will be less about introducing new technologies and

“NEXT DECADE ABOUT EMBEDDING TECH IN DAILY FARMING DECISIONS”

As agritech funding revives, the sector is entering a new phase of evolution. In a conversation with Business Today, Sunil Kataria, CEO & MD of Godrej Agrovet, talks about why the next decade will be defined by integration rather than disruption and the growing role of AI and climate-resilient technologies. Edited excerpts:

more about embedding them into daily farming decisions.

►►►

Q. The first decade of agritech was about start-up creation. Will the next decade be about integration with larger agricultural and food companies?

I believe the next decade will be defined by integration and collaboration rather than standalone disruption.

The first phase of Agritech focused on proving that technology could address longstanding inefficiencies in agriculture. Entrepreneurs developed solutions

across advisory services, marketplaces, logistics, financing, traceability, and farm management. That innovation was essential because it demonstrated what technology could do for agriculture.

The next phase is about embedding those solutions within
