INDIA MAY HAVE JOINED THE
MANUFACTURING RACE LATE, BUT A NEW
GENERATION OF FACTORIES COULD HELP IT
LEAPFROG INTO GLOBAL COMPETITIVENESS

WHEN HENRY FORD introduced the moving assembly line at his automobile factory in 1913, it changed the economics of production. Cars could be built faster, more consistently and at lower cost, helping transform the automobile from a luxury product into a mass-market one.

More than a century later, manufacturers are once again experimenting with technologies that promise to reshape how factories operate. Artificial intelligence (AI), robotics, digital twins and connected machines are influencing product design, quality control, inventory management, and maintenance.

As India scales its electronics manufacturing, companies will have to look at making more and more components locally. And end-to-end manufacturing is different from assembling. “A manufacturer of components is dealing with far more complexity than someone who is assembling those
