for both the domestic market and healthcare systems worldwide,” he says. India also has a significant opportunity to move up the value chain through import substitution in high-end medical technologies.

“While the country has strong capabilities in consumables and low and medium technology medical devices, the future lies in developing advanced, innovation-led products such as cardiac implants, interventional devices, orthopaedic implants, robotic-assisted technologies, advanced diagnostics and AI-enabled medical devices,” says Baid.

ENABLING CONDITIONS

“As Indian companies continue to invest in R&D, technology partnerships and manufacturing capabilities, we expect the industry to transition from being primarily a

manufacturer of consumables to becoming a global hub for high-value technologies and innovations,” says Baid.

AIMED says the government should ensure enabling conditions such as capital subsidies and affordable credit for MSMEs and start-ups, infrastructure support through MedTech parks with shared testing and certification facilities, technology transfer partnerships with global leaders and clear regulatory pathways that reduce compliance burden and litigation risk.

For domestic players, international expansion is a key growth driver. Polymedicure says its international business contributed nearly ₹1,280 crore in FY26, accounting for close to 68% of revenue. “We have set ourselves the ambition of growing this at a CAGR

of 20% for the next five years. This growth will be supported by a pipeline of more than 50 products under development, expansion of our manufacturing footprint with two new upcoming facilities, expansion into new markets, stronger direct-market operations, and deeper engagement with healthcare providers globally,” says Baid. Philips has invested about €174 million in India over the past six years across R&D, manufacturing, digital capabilities and innovation infrastructure.

“India is also a key manufacturing hub within Philips’ global network. Our Pune facility exports to more than 100 countries and serves as the global manufacturing site for certain specialised product categories,” says Sesha. **BT**
