

ANDHRA PRADESH

on making the government faster, more responsive, and more accountable. Beyond governance, Andhra Pradesh is emerging as an AI infrastructure hub. We are building large-scale data centre capacity, promoting AI adoption across government and industry, and creating a broader innovation ecosystem that includes quantum computing, advanced research and start-up incubation.

We believe AI will transform manufacturing itself, from predictive maintenance and quality control to supply chain optimisation and energy efficiency. We want Andhra Pradesh to be where this transformation happens.

The Centre is pushing electronics and semiconductor manufacturing. What role do you see for Andhra Pradesh in India's ambition?

100 |

OUR GOVERNMENT'S PHILOSOPHY IS BUILT AROUND THREE PRINCIPLES, WHICH I CALL THE THREE S'S: SIMPLE, SPEED AND STABILITY... WE BELIEVE GOVERNMENTS MUST BEHAVE LIKE LONG-TERM PARTNERS IN THE INDUSTRY

India's electronics manufacturing story cannot succeed without strong regional manufacturing ecosystems, and Andhra Pradesh intends to play a leading role. We already have a large electronics manufacturing ecosystem in Sri City. One of LG Electronics' largest factories is coming up in Andhra Pradesh. In addition, Sri City currently manufactures close to 50% of India's air conditioners, and that is expected to increase to 70% over the next couple of years. In the same region, we are building an ecosystem spanning electronics manufacturing, component production, electronics system design, advanced packaging, AI infrastructure, and specialised talent development.

Global companies are diversifying supply chains beyond China. How successful has Andhra Pradesh been in attracting these investments, and which geographies are you targeting?

The global supply chain realignment presents one of the biggest opportunities India has seen in decades.

We have witnessed strong investor interest from Japan, South Korea, Taiwan, Singapore, the UAE, Europe and the United States across electronics, advanced manufacturing, renewable energy, logistics
