

Sunil Vachani, Founder and Executive Chairman, Dixon Technologies

Moving Beyond Assembly

From displays to camera modules, the electronics maker is moving into higher value segments

BY KARAN DHAR

FROM ASSEMBLING CATHODE ray tube (CRT) televisions for Lucky Goldstar in 1993 to making smartphones for global brands, Dixon Technologies has become a manufacturing powerhouse. “We started with a rented factory in Noida 33 years back. We only had 10 people. Fast forward to now, we have 25 manufacturing units and two more are on the way,” Sunil Vachani, founder and executive chairman of Dixon Technologies, tells *Business Today*.

The next phase is moving beyond assembly. The company is investing in backward integration of display and camera modules. After entering smartphone camera modules in 2025, it formed a joint venture with China’s HKC for displays and plans TFT LCD displays for automotive, laptop and mobile phone segments.

“One of the criticisms from critics has been that your value addition is very low. But with these two

IN LAPTOP DISPLAYS, THE PLAN IS TO HAVE A CAPACITY OF 1.5 MILLION PIECES A YEAR. IN MOBILE, AT LEAST 30 MILLION PIECES A YEAR”

plants of camera and display module, we will leapfrog to a value addition of 35% in a very short period of time,” says Vachani.

“In laptop displays, the plan is to have a capacity of 1.5 million pieces a year. In mobile, at least 30 million pieces a year. In TV, we are looking at a capacity of 3.5 million pieces a year. It is going to add significantly to the bottom line because margin in the components business is much better than the EMS business,” says Vachani, adding that the company is in talks with auto-makers to sell display modules.

The Delhi-based EMS firm has tied up with Taiwan’s Inventec for laptop and PC components. “We believe that this partnership with Inventec will help us get a big share of the requirement of data centres,” says Vachani.

Its 51:49 joint venture with Vivo is expected to begin operations in Q3 FY27, giving Vivo a majority-Indian-owned manufacturing structure while deepening Dixon’s smartphone presence.

After a greenfield one-million-square-foot factory in Noida, Dixon is weighing a South India campus and is in talks with Andhra Pradesh, says Vachani.

Over the years, Dixon has built enduring relationships. One early customer was Philips, for which it made VCRs. More recently, it signed a joint venture with Signify, the Philips lighting business, to make lighting products for Indian and global markets.

Dixon’s early association with Bharti Airtel included push-button phones and AT&T-branded handsets. Today, the two have a joint venture to make consumer and telecom products.

“Our vision is whenever someone thinks globally of outsourcing, they should think of India and Dixon. That’s the kind of trust we need to establish with customers,” says Vachani. **BT**
