

Rising Presence

Sun Pharma is scaling up its global manufacturing engine to fuel growth across generics, complex medicines, biosimilars and innovative therapies

BY NEETU CHANDRA SHARMA

SUN PHARMA IS strengthening its manufacturing base as it expands its portfolio across generics, branded products, complex medicines and innovative medicines. Its proposed \$11.75-billion acquisition of Organon is part of this wider expansion.

The company has 27 finished-dosage manufacturing facilities and 13 API facilities, with capabilities spanning oncology, hormones, peptides and steroids. Its facilities manufacture multiple dosage forms, including orals, creams, ointments, injectables, sprays and liquids.

The network spans India, the Americas, Asia, Africa, Australia and Europe. Sun says its vertically integrated manufacturing infrastructure enables high-quality, cost-effective production and swift market entry across geographies. Its manufacturing facilities are approved

by leading regulatory authorities, including the USFDA, UK MHRA, EMA, TGA, WHO and Japan's PMDA.

The manufacturing base is supporting a business that is also changing in composition. In FY26, Sun Pharma's consolidated revenues grew 11.9% to ₹58,200 crore, while EBITDA rose 16.1% to ₹17,700 crore. Its Innovative Medicines business contributed 22% of consolidated sales.

The Organon acquisition will add three distinct businesses to Sun Pharma's portfolio. The first is its innovative medicines business, focused on contraception and fertility. The second is its established-products business, which accounts for more than half of the portfolio. The third is biosimilars, a segment new to Sun Pharma.

"Biosimilars is a new business for us, but similar in nature to how we do generic business on the synthetic side," Kirti Ganorkar, Managing Director of Sun Pharma, tells *Business Today*. "There are already seven biosimilars in Organon's portfolio, and we can license more products, including from China, to expand this segment."

Ganorkar said the company could use China not only as a market but also as a source of innovation in biosimilars. "We also see China as a country where significant innovation is happening in biosimilars," he said.

Sun's manufacturing footprint also supports its expansion in emerging markets. The company has local manufacturing in nine countries in the region, in-

cluding Bangladesh, South Africa, Malaysia, Romania, Egypt, Morocco, Nigeria and Russia. Revenue from Emerging Markets grew 18.8% in FY26 to ₹11,187 crore.

Manufacturing efficiency is also part of the company's agenda. Sun says 52.55% of its total energy consumption in FY26 came from renewable sources, compared with 49.77% in FY25. **BT**
