Tata Motors Passenger Vehicles aims to nearly double its volumes by FY31

BY KARAN DHAR

TATA MOTORS PASSENGER Vehicles has made a remarkable ascent in India's car market, overtaking rivals to become India's second-largest carmaker by domestic sales in the first four months of FY27. The homegrown carmaker's market share rose from a modest 4.8% in FY20 to 13% in FY26. In July 2026, it hit a high of 14%. The automaker is now eyeing a 20% share over the next five years by nearly doubling volumes from about 6,40,000 units in FY26 to more than 1.2 million units by FY31.

Tata Motors PV is looking to increase annual manufacturing capacity from 900,000 units to 1.3 million units over the next two to three years.

"We will expand our manufacturing capacity by 400,000 units annually, through brownfield expansion and optimising capacity for existing plants. Our aim will be to ensure that our manufacturing capacity remains flexible and fungible across products and powertrains, such that we are able to ensure higher utilisation," Shailesh Chandra, MD & CEO of Tata Motors PV, tells *Business Today* in an interview.

Tata Motors PV currently operates manufacturing facilities in Pune, Maharashtra, and Sanand, Gujarat. The carmaker plans to use the Panapakkam plant, currently operated by JLR, to manufacture its next-generation electric vehicle, the Avinya.

As India's largest electric carmaker, manufacturing flexibility is fundamental to its operations. "Our lines are entirely fungible by design, and thus, on the same line we can produce EVs (electric vehicles), CNG, petrol and diesel vehicles," says Chandra. "This enables production volumes to be adjusted based on market demand," he adds. Tata Motors plans to expand its portfolio from 9 to 15 nameplates by FY31, comprising six new nameplates and over 20 facelifts and refreshes.

Over the past two months, EV bookings have trebled. "The Indian automotive market has reached an inflection point, particularly in e-mobility, where mainstream adoption is accelerating faster than global trends," says Chandra. The carmaker's EV capacity

OUR LINES ARE ENTIRELY FUNGIBLE BY DESIGN, AND THUS, ON THE SAME LINE WE CAN PRODUCE CNG, PETROL, DIESEL VEHICLES AND EVs"

stood at around 15,000 units per month at the end of the June quarter. Supply is the real constraint in fully unleashing the potential of EVs. Chandra expects EV sales to grow 70% year-on-year in FY27. **BT**
