

Capacity Buildout

Gujarat State Fertilizers and Chemicals Ltd's long-term objective is to progressively increase its contribution to India's fertiliser demand

BY RICHA SHARMA

THE GULF CONFLICT posed one of the biggest challenges for India's agriculture sector, disrupting fertiliser imports. Indian fertiliser manufacturers are now looking to ramp up domestic production and diversify into high-value, import-dependent products, subject to market and financial viability.

Gujarat State Fertilizers and Chemicals (GSFC) Ltd, a Gujarat government-promoted undertaking, is focusing over the next five years on expanding fertiliser production, strengthening its raw material base through backward integration, and increasing its presence in specialty chemicals and value-added products.

Rajender Kumar, Managing Director, GSFC, said the company's long-term objective is to progressively increase its contribution to India's fertiliser demand while supporting the vision of self-reliance in manufacturing.

"In fertilisers, the company is undertaking phased expansion of sulphuric acid and phosphoric acid capacities to secure the raw material base by backward integration, efficiency gains and operating at the scale required to increase fertiliser production. Similarly, we are strengthening our portfolio of value-added and specialty fertilisers that improve nutrient-use efficiency and support balanced fertilisation," said Kumar.

"We are planning for diversification into high-value, import-dependent products, subject to market and financial viability and receipt of necessary approvals," Kumar explained.

GSFC is looking to strengthen its global footprint by leveraging free trade agreements (FTAs) as a strategic tool for export growth.

"Over the coming years, significant investments will be directed towards expanding fertiliser manufacturing infrastructure, including additional sulphuric acid and phosphoric acid capacities, strengthening raw material

availability and improving operational flexibility. Parallel investments will support downstream value-added fertiliser products and specialty chemicals," he adds.

On the chemicals front, the company is leveraging its leadership in products such as Caprolactam, Melamine, Nylon-6, Hydroxylamine Sulphate, and MEK Oxime to diversify into high-value specialty chemicals, engineering polymers and advanced materials catering to rapidly growing sectors. **BT**
