

Green Hydrogen Policy 2024

FOCUS
UTTAR PRADESH

As India moves towards cleaner energy, Uttar Pradesh is entering the emerging green hydrogen market. The Uttar Pradesh Green Hydrogen Policy, supported by the UP Green Hydrogen Mission, aims to build a production base for green hydrogen and green ammonia, targeting 1 million tonnes by 2028. Green hydrogen can help decarbonise difficult-to-clean sectors. Refineries, fertiliser plants and other large industrial users are likely to be

important early markets. By developing production capacity close to these users, Uttar Pradesh can connect clean-fuel generation with industrial demand while opening avenues for investment. The state's proposition goes beyond subsidies. Large green hydrogen projects need land, renewable power, infrastructure and predictable approvals. By bringing these requirements together within one framework, Uttar Pradesh is attempting to make the state an attractive base for an industry taking shape.

Narendra Modi
Prime Minister of India

Creating an Industrial Base for Clean Hydrogen

The opportunity extends beyond hydrogen production. A growing industry can create demand for renewable energy, electrolysers, storage systems, transport infrastructure, engineering services and specialised technologies. That gives Uttar Pradesh the chance to develop capabilities across a wider clean-energy value chain. As projects scale, they could attract suppliers and technology providers, create specialised employment and build expertise around one of the world's emerging energy industries.

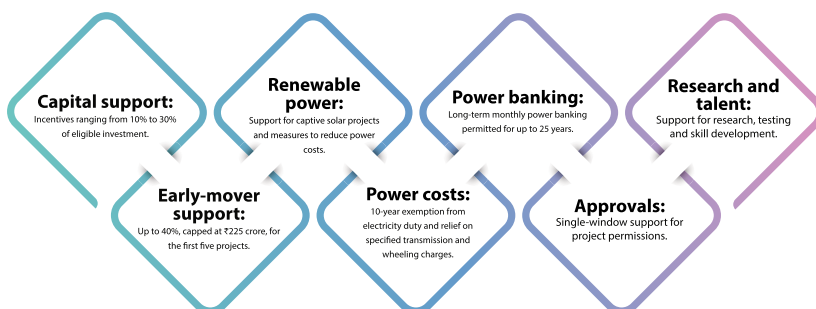

Renewable Power at the Heart of the Opportunity

The economics of green hydrogen are closely tied to the availability and cost of renewable electricity. Uttar Pradesh's strategy places clean power at the centre of the opportunity, giving producers greater scope to secure renewable energy and improve long-term cost predictability. This could prove important as the industry moves towards commercial scale. The ability to produce hydrogen reliably and competitively will determine how quickly industrial users can adopt it and how attractive the sector becomes for investors. The state is also looking beyond physical infrastructure. Research, testing and skill development can help create the specialists needed to support production, storage, transport and other parts of the hydrogen value chain.

Laying the Groundwork for Green Hydrogen

The policy is attracting interest from companies exploring green hydrogen and green ammonia projects in Uttar Pradesh, with multiple MoUs signed for proposed investments. While the industry is still at an early stage, this interest suggests that the state's combination of land, power, infrastructure and policy support is attracting attention. For Uttar Pradesh, the green hydrogen opportunity is about more than producing a cleaner fuel. It is about securing an early position in a new industrial value chain and building capabilities that could allow the state to participate in its growth over the coming decade.

Key Policy Highlights

At a Glance

Production target: 1 million tonnes of green hydrogen and green ammonia by 2028

Early-mover incentive: Up to 40%, capped at ₹225 crore

Power banking: Up to 25 years

Core users: Refineries, fertiliser plants and other large industrial consumers
