

der the existing policy framework, incentives include interest subsidies, investment/SGST-linked incentives, employment-generation support, stamp-duty and electricity-duty benefits, depending on the enterprise and location.

We are also strengthening cluster-based development. Haryana has identified clusters ranging from auto components and engineering to textiles, food processing and electronics, while the Programme to Accelerate Development for MSME Advancement (PADMA) launched this year provides support for capital investment, cluster infrastructure, branding, marketing and exports. Our philosophy is simple—an MSME should not remain small because of lack of access to finance, technology, markets or infrastructure.

We have launched the Haryana Progressive MSME

“The next phase of Haryana’s industrial growth will be driven by sunrise sectors and advanced manufacturing”

and Export Promotion Policy 2026 to attract over ₹55,000 crore in manufacturing investment, create over five lakh new jobs and double the state’s exports by 2031. The policy has been prepared with ‘Make in India’ and ‘Make in Haryana’ at its core and introduces 60 transformative initiatives designed to strengthen the sector and enhance Haryana’s export competitiveness.

Q: Haryana is a key auto manufacturing hub. What is the roadmap for going beyond NCR?

A: This is one of our major priorities. Haryana’s industrial growth cannot remain concentrated around Gurugram, Faridabad and the NCR. We are pursuing a balanced regional industrialisation model, using the strengths of different parts of the state.

Look at different districts—Ambala for engineering and electronics, Panipat for textiles and home furnishings, Karnal for agro-processing and food-related industries, Hisar for textiles and engineering, Rohtak and

Rewari for engineering and auto-related industries, Sirsa and Fatehabad for agriculture and allied manufacturing and Kurukshetra and Kaithal for agro-based industries

The state has already identified cluster projects across these regions. Our aim is to create multiple industrial growth centres, so that investment, employment and economic opportunities reach every region of Haryana.

Q: What are the new manufacturing sectors that the state is looking at?

A: The next phase of Haryana’s industrial growth will be driven by sunrise sectors and advanced manufacturing. Our identified thrust sectors already include electronics and IT/ITeS, defence and aerospace, renewable energy and solar, pharmaceuticals and chemicals, besides our traditional strengths in automobiles, engineering, textiles and food processing.

We are particularly looking at areas such as electronics and semiconductor-linked manufacturing, electric vehicles and advanced batteries, renewable energy and clean-tech manufacturing, defence and aerospace, pharmaceuticals and medical technology, Industry 4.0, robotics and automation and AVGC-XR and technology-enabled services. AVGC-XR technology encompasses the integration of Animation, Visual Effects, Gaming, Comics, and Extended Reality into a single ecosystem.

For example, Haryana’s Electronics System Design and Manufacturing Policy 2026 provides additional support to electronics manufacturing, including support linked to the government of India’s PLI and semiconductor programmes. So, our vision is clear, that Haryana should not only manufacture today’s products; it should manufacture the products that India and the world will need tomorrow.

Q: How do you plan to get investments and global investors?

A: Our message to investors is very clear. Haryana offers connectivity, infrastructure, skilled manpower, a strong industrial ecosystem and a government committed to ease of doing business. We are moving from a traditional approval-oriented approach to a facilitation-oriented approach. Haryana’s enterprise-promotion framework provides mechanisms for time-bound clearances, while recent reforms have further simplified approvals and reduced regulatory burdens. We also believe that investors today look beyond
