study, were ranked based on their latest available absolute values. The state with the highest value received Rank 1 and was awarded the highest score for that parameter, followed by the remaining states in descending order. In addition to the latest performance, states were also ranked based on their 10-year growth and 5-year growth for each parameter. For exports, long-term growth was assessed over a seven-year period (FY18–FY25) due to the

limited availability of comparable historical data.

For every parameter, three separate scores—based on the latest absolute performance, 10-year growth, and 5-year growth—were therefore assigned. These three scores were combined to arrive at a composite score for each parameter, ensuring that both the current strength of a state's manufacturing ecosystem and its growth trajectory were reflected

in the assessment.

The composite scores across all seven parameters were then aggregated to calculate a final blended score for every state. States were subsequently ranked based on their overall scores, and the Top 10 states with the highest final blended scores were recognised as India's leading manufacturing states. **BT**
