

The manufacturing economy of the future will be driven by software, AI, robotics, R&D, and precision manufacturing. Telangana already has the capabilities to lead. Our vision is to build a \$3-trillion economy by 2047 and increase Telangana's contribution to India's GDP from 5% to 10%. Achieving that means moving decisively up the global value chain—from providing services and assembling products to designing, engineering, and manufacturing the technologies of the future.

By 2047, I want Telangana to be known not only as India's technology capital, but as one of the world's leading innovation ecosystems.

Hyderabad has emerged as India's leading Global Capability Centre (GCC) hub. How can GCCs contribute to the state's manufacturing ambitions through R&D, engineering, and product development?

Manufacturing has changed. It no longer begins on the factory floor; it begins in research labs, engineering centres, and product design studios. That is why GCCs have become so important.

Today's GCCs are not back offices. They are where companies develop new products, design semiconductors, build robotics and AI platforms, run simulations, and solve complex engineering problems. The intellectual property created in these centres ultimately shapes what gets built, how it gets built, and how globally competitive it becomes.

We are already seeing this in Telangana. Over the last 30 months, Hyderabad has attracted 150+ GCCs, creating 150,000 high-value direct jobs and over 600,000 indirect jobs. Nearly 46% of India's greenfield GCCs chose Telangana, with companies such as Vanguard, Southwest Airline, Nationwide India, The Hartford, McDonald's, L'Oréal, Netflix, and Marriott have established their first engineering centers here.

More importantly, we are bringing together innovation centres across diverse industry domains to unlock cross-domain innovation, accelerate knowledge transfer, and create collective value. This ecosystem is already encouraging companies such as Lilly and Align Technologies to establish manufacturing facilities.

Telangana has been proactive in AI and emerging technologies. How do you see AI transforming manufacturing, supply chains, and industrial productivity over the next decade?

I believe AI will define the next decade of industrial growth. It is going to transform manufacturing through smarter production, improved quality, lower costs, and more efficient plant operations.

Our role is to create talent and the right environment for businesses to embrace AI with confidence. For Telangana, this is an opportunity to move up the value chain, build globally competitive industries, and create high-value jobs for our young people.

How is Telangana building an innovation ecosystem for next-generation manufacturing?

Innovation happens when academia, start-ups, industry and government work together with a shared purpose. That is the ecosystem we are building in Telangana.

Every globally competitive innovation ecosystem rests on four foundations. The first is talent. We are bringing industry into the classroom, so our workforce is ready for tomorrow's jobs. The second is innovation. Through AIKAM (global AI innovation hub), TGDeX (Telangana Data Exchange Platform), and platforms like 1Bio (single-use bioprocess scale-up facility), we are connecting academia, researchers, start-ups, and industry to turn ideas into products faster. The third is infrastructure. Investments in AI City, Bharat Future City, the Regional Ring Road, Metro expansion, and airport connectivity are creating an environment where businesses and talent can thrive. Finally, policy. We remain committed to a stable, transparent, and industry-friendly regulatory environment that gives businesses the confidence to invest and grow.

I do not see this as a choice between different sectors. These industries are increasingly interconnected. A semiconductor designed today could power an electric vehicle, enable an AI-powered medical device, or become part of a defence platform. They all depend on advanced engineering, AI, robotics, electronics, research, and skilled talent. We are home to over 1,500 technology companies, nearly 300,000 AI professionals, and more than 50,000 chip designers.

Semiconductor investments have become highly competitive globally. How is Telangana positioning to attract semiconductor and electronics manufacturing projects?

Hyderabad is home to companies such as AMD, Qualcomm, Micron, and Allegro MicroSystems, with thousands of engineers working on chip design,
