One of Tamil Nadu's greatest strengths has been its ability to stay a step ahead. Over the decades, successive industrial policies have anticipated where manufacturing was heading and positioned the state accordingly. Whether it was automobiles, textiles, electronics or electric mobility, Tamil Nadu has consistently adapted to changing industrial realities while providing investors with stability and confidence.

That continuity has been one of the defining features of our industrial ecosystem. A few things matter to businesses such as predictability, ease-of-doing business and speed of execution. Institutions such as Guidance Tamil Nadu, combined with progressive sector-specific policies, have helped deliver exactly that.

The next wave will be driven by semiconductors,

advanced electronics, artificial intelligence (AI)-enabled manufacturing, clean energy technologies, aerospace, advanced materials and high-value engineering. Our responsibility is not merely to respond to these changes, but to prepare for them before they become mainstream.

That is the philosophy behind our work on Industrial Policy 2026. We are not preparing for the next investment cycle; we are preparing Tamil Nadu for the next decade of global manufacturing. The policy will focus on moving the state further up the value chain by attracting integrated manufacturing, design, engineering, research and innovation-led investments, while creating the high-quality, white-collar employment opportunities that will define the economy of the future.
