## STRATEGIC EXPANSION

| Focus Area                                   | Details                                                                                                                                             |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Specialty Carbon Black</b>                | Total capacity: 1,30,000 MTPA (includes new 70,000 MTPA line at Mahistikry, Singur)                                                                 |
| <b>Coal Tar Pitch</b>                        | Core product; 65% market share in India                                                                                                             |
| <b>Naphthalene &amp; Refined Naphthalene</b> | 68% market share in India                                                                                                                           |
| <b>Battery Materials</b>                     | Lithium-ion anode & cathode materials; building world's first commercial LFP cathode facility outside China, planned 2,00,000 MT capacity in phases |
| <b>SNF &amp; Specialty Oils</b>              | Part of expanded chemical portfolio                                                                                                                 |
| <b>Financial Discipline</b>                  | Debt-free in FY24; ROCE above 30%                                                                                                                   |
| <b>Global Reach</b>                          | Exports to 56 countries; terminals at Haldia (Southeast Asia & Australia) and New Mangalore Port (Middle East)                                      |
| <b>Sustainability</b>                        | EcoVadis Platinum rating, top 1% globally                                                                                                           |

Company in the US.

Over time, this approach has allowed the company to move beyond standard commodity chemicals toward more specialised materials tailored for particular industrial uses. That same thinking shapes the firm's work on sustainability. Several initiatives under development focus on converting end-of-life tyres, used oils and agricultural residues into usable products.

Choudhary describes the company's current direction as "Himadri Reloaded—The Next Chapter." For him, the phrase captures both continuity and ambition. It acknowledges the company's roots in carbon chemistry while recognising the need to develop materials that will support the technologies of the future. "This reflects how far we have come, the strength we have built through challenges, and the responsibility we carry to grow in a way that is sustainable and inclusive," he says. The larger ambition, Choudhary explains, is to create an organisation where research, disciplined execution and long-term thinking remain central to every decision.

If his frequent references to the laboratory are any indication, that approach will continue to guide the company's journey in the years ahead, he says, smiling as he looks around the lab. **BT**
