

MORE THAN THE SUM OF THE PARTS

Dixon is betting big on backward integration by forming joint ventures to make key electronics components locally

ROM MANUFACTURING cathode ray tube televisions for LG Electronics out of a rented shed in Noida, Uttar Pradesh, 33 years ago to building mega factories that make smartphones and displays for major brands, Dixon Technologies has come a long way.

Riding the government's Make in India push, the electronics manufacturing services (EMS) company has qualified for as many as five production-linked incentive (PLI) schemes over the last five years. "Speed of execution has set us apart," Sunil Vachani, Founder and Executive Chairman of Dixon, tells *BT*.

The growth is visible in its financials. Dixon's topline grew 119% year-on-year to ₹38,887 crore in financial year 2024-25 (FY25). "This year we expect to touch a turnover of almost ₹55,000 crore," says Vachani. "Even though we have come very far, I feel the journey has just begun," he adds.

The first target was achieving scale in all the products that Dixon manufactures. In mobile phones, where the market size is 160 million pieces per year, Dixon has set up a capacity of 70 million. In television, it has a capacity of seven million; the market size is 17 million. In washing machines, it has a capacity of 1.6 million; the market capacity is seven million.
