

serve ordinary people, not just corporations and governments.

ONE DECLARATION

By those measures, the summit delivered. Eighty-eight countries and international organisations signed the New Delhi Declaration on AI, a voluntary framework that includes a Global AI Impact Commons (a shared database of AI use cases for governments to learn from), a Trusted AI Commons of tools and best practices and an international network linking research institutions around the world. The US, China, France, and most other major AI nations all put their names to it, a degree of consensus that the government called unprecedented for a gathering of this kind.

Prime Minister Narendra Modi also unveiled the MANAV Vision, India's ethical framework for AI. The acronym stands for Moral and Ethical Systems, Accountable Governance, National Sovereignty, Accessible and Inclusive, and Valid and Legitimate. The message is clear: "Whose data, his right", a signal that India intends to govern AI on its own terms, shaped by local priorities and the country's vast linguistic diversity.

MONEY POURS IN

On the investment side, the figures were staggering: Reliance Industries Chairman and Managing Director Mukesh Ambani announced plans to pump \$109.8 billion into

AI and data infrastructure over the next seven years; the Adani Group pledged \$100 billion to build AI data centres powered by renewable energy by 2035, projecting that the move could catalyse an additional \$150 billion across connected industries like server manufacturing and sovereign cloud.

American companies showed up with serious commitments too. Microsoft said it is on track to invest \$50 billion across the Global South by 2030, with India as a primary recipient. OpenAI signed a deal with the Tata group to lease 100 megawatts of data centre capacity from Tata's HyperVault and provide advanced models to the firm's employees. Anthropic entered a partnership with Infosys. Google shared new details about its existing \$15 billion investment in Indian AI

infrastructure. Yotta Data Services committed \$2 billion to build one of Asia's largest AI computing hubs, equipped with Nvidia's latest Blackwell Ultra chips.

In total, the government said there were \$250 billion in investment commitments, along with \$20 billion for frontier deep-tech research. The scale of announcements made clear that India's pitch as an AI hub is being taken seriously.

On the fifth day, India formally joined Pax Silica, a US-led coalition designed to secure the global supply chain for silicon-based technologies, from the minerals to the chips in fabrication plants to the data centres running frontier AI. US Under Secretary of State Jacob Helberg called it "a road map for a shared future", framing economic
