

MAPS THE INFORMAL ECONOMY

For years, India's massive informal sector (over 45% of GDP) was an economic ghost. It was assumed that the sector mirrored the formal one—using IIP and big-company data as a proxy to incorporate their representation in GDP calculation. The new GDP methodology ditches the guesswork by plugging in ASUSE and PLFS data to accurately map the gig economy and post-pandemic shifts in consumption pattern

HOW SECTORAL SHARES HAVE CHANGED

With the data overhaul, agriculture isn't just about rice and wheat anymore. The new series better captures the shift towards cash crops, fruits, vegetables, and high-value commodities. These bring in higher profits, boosting value added, which reflects in the sector's rising share

THE CHANGE IN THE CPI BASKET

The Consumer Price Index (CPI) basket too has been revised with adoption of 2024 as the base year, which reflects changing consumption patterns, notably a shift away from basic staples towards services and discretionary goods. The CPI basket was also increased to 358 items, and includes 12 online markets
