

HOW ADANI ENERGY SOLUTIONS IS REWIRING INDIA'S POWER ECONOMY AT SCALE

The nation's ₹3-lakh crore distribution reform hinges on execution. With over one crore smart meters installed and one of the fastest deployment rates in the country, AESL is positioning itself at the centre of a transformation that is expected to reshape the financial architecture of the power sector.

For years, one chapter has been defined by ambition and achievement. The country has steadily built vast stretches of power infrastructure in the form of massive generation plants, sprawling renewable energy parks shimmering in deserts and inter-state transmission lines that weave the nation together.

With every passing year, India has climbed higher in the ranks of global electricity producers, a symbol of its growing economic and technological might.

But turn the page and the tone shifts.

Here, at the level where electricity meets the consumer, the narrative becomes far more complicated. State-owned distribution companies, known as discoms, have long struggled to keep the system watertight. Billing gaps, electricity theft, tangled subsidy structures and fragile collection mechanisms have weakened the very foundation on which the sector stands. Data from the Power Finance Corporation (PFC) tells this story with stark clarity: Aggregate Technical and Commercial (AT&C) losses have persistently hovered between 16 per cent and 20 per cent nationwide, often soaring even higher in some states. Each time these losses deepen, the familiar cycle repeats: states stepping in with bailouts and yet another attempt at financial restructuring.

So, despite enormous progress upstream, the sector remains held back by the same lingering question: how do you finally fix the last mile?

Adani Energy Solutions has achieved a daily installation rate of 25,000-27,000, highest for any player globally.
