

Major Players by Market Cap

2025 Rank	Vendor	Category	Country/ Headquarters	Market Cap*
1	NVIDIA	Fabless (Design)	USA	\$4.45 trillion
2	TSMC	Fab & Packaging	Taiwan	\$1.85 trillion
3	Broadcom	Fabless (Design)	USA	\$1.51 trillion
4	ASML	Equipment	The Netherlands	\$540 billion
5	Micron	Design + Manufacturing	USA	\$451 billion
6	Samsung Electronics	Design + Manufacturing	South Korea	\$420 billion
7	AMD	Fabless (Design)	USA	\$330 billion
8	Applied Materials	Equipment	USA	\$283 billion
9	LAM Research	Equipment	USA	\$278 billion
10	Intel	Design + Manufacturing	USA	\$227 billion

for decades. Yet, India's role has largely remained that of an enabler rather than an owner. That mindset is changing now.

"At present, many Indian companies are tagged as service companies, providing human resources or services for engineering development. If you have to move out of a service mindset to a product ownership mindset, the starting point is designing an IP or a chip on your own, rather than just providing human resources for somebody else to do that," says Navin Bishnoi, India Country Manager and Associate Vice President at Marvell India, the Indian arm of US-based chip designer Marvell Technology.

Owning the chip, instead of relying on off-the-shelf silicon, gives companies control over performance, cost, security and long-term product road maps. As systems grow more complex and software-driven, differentiation increasingly begins at the silicon layer.

"Today, to be a major player in many industries, you need custom silicon for performance, efficiency, and differentiation—especially in AI/ML (Artificial Intelligence/Machine Learning). Global players like Microsoft, Meta, and AWS have moved into chip design for that edge," says Alok Jain, Corporate Vice President, Research and Development, Cadence Design Systems, one of the world's top three semiconductor electronic
