

AGENTIC AI WILL AMPLIFY HUMAN POTENTIAL, NOT REPLACE IT

Jaime Vallés, VP of Amazon and MD of AWS Global Sales for Asia Pacific, Japan and Greater China, on AI adoption and the tech behemoth's plans in India

BY NEETU CHANDRA SHARMA

AS COMPETITION intensifies in India's cloud market, Amazon's cloud computing arm, Amazon Web Services (AWS), is expanding its investments in what has become one of its most important growth regions. With rivals such as Microsoft and Google accelerating their push into artificial intelligence (AI), competition among cloud providers is increasingly moving beyond infrastructure scale to platforms, developer ecosystems and long-term capability.

India's fast-growing developer base, expanding start-up ecosystem

and rising enterprise adoption of AI make the country a critical market for global cloud providers. At the same time, customers are becoming more demanding, seeking integrated AI platforms, cost-efficient computing models, secure data architecture and faster deployment cycles.

Against this backdrop, AWS is increasing investments in local infrastructure, developer enablement, partner ecosystems and AI capabilities. The company has committed billions of dollars towards expanding its

cloud footprint in India by 2030 as it seeks to support large-scale AI adoption across sectors.

Jaime Vallés, Vice President of Amazon and Managing Director of AWS Global Sales for Asia Pacific, Japan and Greater China (APJC), talks to Business Today about India's importance to AWS, the evolution of generative AI towards agentic systems, cost optimisation strategies and how the company is supporting India's developer ecosystem. Edited excerpts:

Many companies in

India are experimenting with AI. How is AWS enabling large-scale adoption, and which sectors are leading this shift?

From a sector perspective, almost every industry in India is already exploring AI in some form. We see this in our work with the government, with digital-native companies such as Zomato and Swiggy, and with financial institutions. AI adoption is also accelerating in telecom and healthcare. AI brings significant potential to democratise opportunities and access, so every sector stands to benefit.

India remains a key global priority for us, which is why building strong and future-ready infrastructure is foundational. Amazon announced an investment of \$12.7 billion in local cloud infrastructure in India by 2030. Across our businesses, we have also announced plans to invest about \$35 billion in India by 2030 to advance AI innovation.

Access to scalable tools and technologies is critical in the generative AI era. We continue to expand our regional presence, including in Mumbai and Hyderabad, to ensure low-latency, secure and reliable access to cloud technologies.

Customers also need solutions that are secure, easy to use and
