

performance with cost efficiency. These models run on custom-designed processors that help optimise performance while managing computing costs. This allows enterprises and developers to access advanced AI capabilities without the high costs often associated with frontier models.

Customers also benefit from flexibility. They can choose different AI models depending on their requirements for cost, performance or model size. This flexibility allows organisations to align their AI strategy with their budgets.

Another important element is the partner network. Consulting firms, start-ups and independent software vendors work with AWS to help enterprises adopt AI more effectively. We are continuing to expand these partnerships in India and strengthen the marketplace.

India also has one of the largest developer communities in the world. To support them, AWS provides frameworks and tools that help organisations build, test, deploy and scale AI apps more effectively across the development lifecycle.

Innovation hubs also play an important role. These environments allow customers

to move from ideation to proof of concept and into production with built-in security.

Can you share examples of AI adoption in India?

There are several examples across sectors. Kore.ai, a conversational AI company developed in India, is expanding globally with enterprise AI solutions. Zomato has built a no-code agentic AI platform that helps companies automate customer interactions.

We also see strong adoption in traditional industries. Apollo Tyres, Axis Bank and the National Health

Authority are using AI to improve operational efficiency.

In healthcare, the National Health Authority (NHA) has used AI to strengthen fraud detection under the Pradhan Mantri Jan Arogya Yojana (PM-JAY). The system now processes complex claims in about 30 minutes, representing a significant reduction in detection time. Real-time intervention has also improved fraud detection rates, which can translate into substantial savings for the healthcare system.

These examples show how AI is moving beyond experimentation and beginning to

deliver real operational benefits across sectors.

What trends do you see in agentic AI for 2026?

The core idea behind agents is augmenting human capability. Agents allow people to focus on high-value and creative work while technology handles repetitive tasks.

One area where this is becoming evident is software development. AI-assisted development tools are enabling people to turn ideas into working applications much faster, without requiring large engineering teams or deep technical expertise.

This significantly lowers the barriers to
