

“Almost every industry in India is already exploring AI in some form. We see this in our work with the government, with digital-native firms”

innovation. Developers can move from concept to execution much more quickly, which allows organisations to experiment and innovate faster.

A lot of this progress is driven by systems that allow AI models to interact with enterprise data sources and applications. Data remains central to this transformation. Agentic AI helps accelerate execution while amplifying human potential rather than replacing it.

How is AWS supporting India's developer community?

The first step is making technology accessible. Developers need tools

and infrastructure that allow them to experiment and build applications efficiently.

AWS supports start-ups through programmes that provide cloud credits and structured support to help them scale. These credits can also be used for different AI models, giving start-ups flexibility in managing costs.

We also provide access to computing infrastructure, data services and development tools through dedicated start-up teams, innovation labs and technology hubs focused on the Indian market.

India's developer Community is one of the most vibrant in the

world, and enabling this community is central to our long-term strategy.

How is AWS approaching responsible AI?

Security has always been a core priority for us. We embed security into systems from the beginning.

Responsible AI builds on this foundation. Organisations need governance tools that allow them to monitor outputs, reduce the risk of inaccurate responses and enforce policy safeguards.

AI systems often rely on proprietary data, which makes data protection essential. Organisations must be confident that their

data is secure and private.

By integrating governance, security and compliance capabilities directly into AI systems, organisations can innovate while maintaining strong safeguards. Responsible AI is ultimately about protecting data, managing risks and ensuring that technology is used safely.

With rising competition in cloud, how is AWS defending its position?

Competition is natural in a fast-growing market. Our focus remains on providing a broad technology stack that spans infrastructure, custom processors and higher-level AI services.

AI relies heavily on secure and scalable data management. Many organisations need to move workloads to the cloud to fully realise the potential of Gen AI.

Our experience in cloud infrastructure and the breadth of our services provide a strong foundation for that transition. At the same time, investments in skills development and our partner network help customers scale their AI initiatives.

In India, we continue to invest for the long term, combining infrastructure and talent. **BT**
