

# ADANI FOUNDATION'S GROUNDBREAKING WATER CONSERVATION INITIATIVES TRANSFORMING RURAL COMMUNITIES

The threat of climate change looms large, with rising temperatures and depleting resources leading to extreme weather. Water, crucial for climate adaptation, is vital for balancing commercial demands and community needs. For almost three decades, the Adani Foundation has led water conservation efforts across the nation, constructing 15 types of structures and creating over 15 billion litres of storage. These initiatives have benefitted over 191,000 people.

## Case I

Kuran, a village with over 1,800 residents in the Bhuj taluka of Kutch district, Gujarat, endured severe water scarcity due to its arid climate. The lack of water availability threatened the livelihoods and survival of the community and its livestock. For years, women trekked miles under the scorching sun to fetch what little water they could find—until a community-led transformation began. In 2023, Kuran's village leaders turned to the Adani Foundation for assistance. In response, the Foundation renovated a pond and constructed a well, aiming to recharge the groundwater. However, a year later, it became evident that these efforts were insufficient to completely resolve the issue. A thorough assessment led to the digging of a percolation well at a location where water naturally accumulated. At a depth of 50 feet, they found clean drinking water.

## Case II

Gondiya, renowned as the Rice City of India due to its extensive rice mills, faced severe water shortages in the village of Ekodi after the monsoon season. With their only pond drying up within months, farmers found it increasingly challenging to sustain

their paddy fields, a crop that demands significant water, thereby endangering both their livelihoods and their access to potable water. In a proactive response, the Adani Foundation launched a water conservation initiative in 2021. This project centered on deepening the village pond and improving the associated channels to boost the pond's capacity and rejuvenate this essential water source. These measures were aimed at ensuring the farmers' survival and supporting the local ecosystem.

## Case III

The tribal village of Ghoti, situated in the Tiroda block of Gondiya district near the Nawegaon-Nagzira Tiger Reserve in Maharashtra, witnessed a transformative initiative with the deepening of its pond. This effort substantially increased the water storage capacity, enabling local farmers to cultivate two crops per year. The resultant boost in agricultural productivity was complemented by a reliable water source for
