

gy, green hydrogen, downstream industries. I am planning to attract ₹10-lakh crore investment in green hydrogen, 0.75 million employment. Honourable Prime Minister has laid the inaugural foundation for ₹2 lakh crore. In that biggest investment is ₹1.87 lakh crore green hydrogen by NTPC and Genco joint venture.

Now in Andhra, Rayalaseema, we have an advantage. One is solar. India is blessed. Wind energy, we have maximum advantages. Ports are available. I can go for manufacturing green hydrogen downstream industries.

Andhra Pradesh will become logistics hub for India.

**What kind of conversations have you had with global corporates over here?**

I am focussing on green energy, green hydrogen, downstream industries. Second one - logistics, how to promote, how to integrate.

Twenty-five years back, I started IT (information technology). Now, we have reached AI (artificial intelligence). Now, I am talking about deep technology, even open access for all people, AI modules available. Not only open access, even others also if you can provide for people, how it will be that money government has to pay and provide for everybody.

Here is what I am thinking today, with all these things about how to integrate and grow at the rate of 15%.

**You've been coming to Davos since the mid-90s. How have you seen India's position in the eyes of Davos and in the eyes of the world changing in this long journey?**

In 1995-96, I used to come here. I used to participate in so many sessions. Whenever I used to

say something, nobody used to believe. At that time, I used to say one thing. British left English to Indians. We are very strong in mathematics. Then, naturally, we are very strong in information technology. This is where I narrated and started and then I used to bring people to India, especially Hyderabad at that time.

Today, everybody believes in and is trusting the Indian growth story.

▶▶▶

**How are you leveraging and harnessing the potential of AI to improve governance and what are your suggestions for other states and for policy makers to try and implement AI to make the lives of common people better?**

When I started information technology, nobody believed me. I was a strong supporter of deregulation of telecommunications sector. Finally, I gave a report to (Atal Bihari) Vajpayeeji. That is how it has happened. Today, you have seen the total change, from information technology to AI. Now, we are going for deep technology.

According to me, medical technology, agriculture technology, logistics technology, power technology, all these things are going to become a reality. Governments must adopt it, use it properly and only cautiously. We should not lose our ethics.

▶▶▶

**How are you leveraging the capabilities of the influential non-resident Telugu community?**

We will work it out. The Global Leadership Centre in Amravati is to promote Indian leaders and Telugu leaders globally. **BT**
