and Astro-Vision lead the sector, according to Tracxn.

Marmik Mankodi of Blume Ventures, which backs InstaAstro, notes a curious paradox: while the space is growing fast and companies are delivering strong results, the lack of global benchmarks for successful exits remains a challenge. This gap leaves investors only cautiously optimistic.

## ENDGAME

Mankodi believes deal-making activity could pick up once there is greater clarity on the long-term potential and endgame for the sector. Comparing the current landscape to Astrotalk, he notes that newer start-ups might emerge to expand the market and potentially reach Astrotalk's scale, while Astrotalk itself continues to grow steadily.

All the leading players in the astrotech sector are actively targeting overseas markets. According to Gupta from Astrotalk, the company generates a daily revenue of ₹20 lakh from the US market. While this is relatively modest compared to its daily revenue in India, the firm is aggressively expanding its presence in the US, focusing on the NRI audience. Similarly, for AstroSage, approximately 25% of its revenue comes from international markets. In the West, apps like Moonly and Co-Star have gained prominence.

Beyond astrology, the broader religious tech space, including e-commerce platforms like AppsforBharat, are thriving, having secured \$892 million in funding so far, according to Tracxn.

The stars and prospects of the sector seem to be in alignment. **BT**
