In 2024 as a whole, EVs accounted for 40% of car sales in China. By the end of this year, China's EV market share is projected to reach 50% and India's 7-8%. China sold 11 million EVs in 2024, according to Rho Motion, a UK-based EV research firm.

INDIA FOCUS

Even so, when it comes to India, BYD and VinFast, Vietnam's rising powerhouse, are going all in. VinFast has debuted with premium electric SUVs VF3 and VF7 and plans to launch its first locally assembled EV this year. BYD, in India since 2007, is expanding its lineup with the ATTO 3, eMAX7, SEAL, and SEALION 7, planning to import vehicles for the Indian market. It is eyeing emerging markets, expanding exports to 95 countries and planning assembly plants in 10.

MG Motor, backed by China's state-owned automaker SAIC, has formed a joint venture with Sajjan Jindal's JSW Group.

Parth Jindal, director of JSW MG Motor India, says the foreign partner is optimistic about the Indian market's potential. "MG Motor does understand the power of the Indian market. It sees India as a huge growth avenue As China starts slowing down, and the situation in Europe remains uncertain, the real growth is coming from India," he says.

JSW MG Motor India currently operates in the

mass market segment, which has become the biggest attraction for EV makers.

The company is closing the EV gap with market leader Tata Motors. The company cornered a market share of 37% by selling 4,255 units in CY24. Its sales were just 782 units short of Tata Motors, which sold 5,037 units for a market share of 45%. Windsor EV by JSW MG Motor, which follows a BaaS (Battery-as-a-Service) model, has raced past the electric versions of Tata Motors' Nexon and Punch.

BaaS allows buyers a lower initial cost and pay for the battery on a pay-per-use model.

DRIVEN BY SUBSIDIES

Chinese EV makers, backed by lucrative government incentives, competitive pricing and low-cost manufacturing, are known for disrupting the markets they enter.

Since 2014, the government reimbursed buyers to the tune of 60,000 yuan (\$8,375) for every electric car they purchased. In 2023, it introduced a 520 billion yuan (\$72.3 billion) tax incentive package, offering a full tax break of up to 30,000 yuan (\$4,170) per vehicle in 2024-25, halving to 15,000 yuan in 2026-27.

Consumers replacing conventional cars with EVs are offered a 20,000 yuan (\$2,770) subsidy and EVs priced under 300,000 yuan come with a 10% subsidy until the
