

by a dual mandate: advancing India's industrial capabilities and addressing global sustainability imperatives by carrying out our operations responsibly. By bringing together value chain expertise with cutting-edge R&D, Himadri is not just adapting to market shifts but defining them, ensuring sustained value for stakeholders and a lasting impact on the carbon value chain.

Q How do you envision the company shaping the next decade of innovation in sustainability-driven industries? What strategic priorities will propel Himadri to not only lead India's 'green industrialization' but also cement its role as a global disruptor in critical sectors like battery technology and renewable energy infrastructure?

The climate crisis is no longer a distant threat—it is an urgent reality. Global CO₂ emissions are projected to be 41.6 billion tonnes in 2024, while extreme weather events have been estimated to have cost the world \$2 trillion over the last decade. India, home to 18% of humanity, faces a dual challenge: driving economic growth while decarbonizing industries. The solution lies in two transformative megatrends: renewable energy and

electric mobility. Renewables now account for 30% of global electricity generation, with PV solar capacity set to triple by 2030. Simultaneously, the EV revolution is accelerating—global EV sales surged to 17.1 million units in 2024, and India aims for 30% EV adoption by 2030.

The crux of this transition is energy storage systems and solutions. By 2030, the global energy storage market will exceed \$500 billion, with lithium-ion batteries dominating but newer technologies gaining ground. This is where Himadri's strategic focus converges. Positioned at the intersection of climate action and industrial progress, we aim to redefine energy storage through cutting-edge innovation.

Our R&D teams are advancing multiple frontiers in battery material technology to democratize storage solutions. In terms of Cathode Innovations, in addition to aforementioned initiatives of scaling production of LFP (Lithium Iron Phosphate) cathode material (200,000 MTPA by 2030) while also researching on LMFP (Lithium Manganese Iron Phosphate) for higher energy density and thermal stability. Our research is also taking us beyond lithium towards exploring Sodium-Ion (Na-ion) batteries—a potentially cost-effective,

resource-abundant alternative—to reduce reliance on critical rare minerals. In terms of Anode Breakthroughs, we have been deeply involved with different anode chemistries like natural graphite, synthetic graphite, and silicon-carbon composites that have the potential to not just boost battery capacity but also significantly improve charging times. Our foresight has enabled us to proactively recognize that the anticipated proliferation of batteries in the future will present a new challenge: ensuring safe disposal and material recovery. It gives me great pleasure to say that our teams are also working on this domain.

Beyond batteries, we are also working on harnessing nanotechnology to solve cross-industry challenges— a potential Game Changer', with a desire to develop solutions not just in the realm of battery technology but also contribute to the development of the farmer community in India and globally with a bouquet of disruptive agri offerings.

The next decade and the future will belong to companies that merge industrial ambition with planetary responsibility. By anchoring innovation in sustainability, Himadri aims to power a cleaner, greener future and contribute towards making a truly Atmanirbhar Bharat.
