curity hold for arrival and departure passengers could help reduce costs and in faster aircraft turnarounds.

Efficient airspace management: ANS infrastructure, manpower and training levels require continuous augmentation. Optimising aircraft

separation protocols and upgrading the rated capacity of Indian airports could increase the number of aircraft movements per hour. Use of GAGAN—the satellite-based augmentation system jointly developed by ISRO and AAI—could be encouraged to increase airspace capacity

and help reduce the cost of ANS infrastructure at regional airports.

Leave no one behind: Cargo, ground handling, general aviation and MRO entities form a critical part of the aviation value chain but often complain of unfair treatment
