solutions, Polymatech is contributing to India's long-term vision of a robust and self-sufficient supply chain.

Sapphire Ingot & Sapphire Wafer

Sapphire Ingots and Wafers are critical components in the semiconductor industry, offering high mechanical strength, thermal conductivity, electrical insulation, and optical transparency. These materials are widely used in LED substrates for GaN-based LEDs, power devices and laser diodes for efficient heat dissipation, RF devices in mobile phones for high dielectric strength, semiconductor wafers for high-frequency and microwave applications, and electronics designed for harsh

environments such as space and military applications.

6G Telecom Die

The 6G Telecom Die represents a breakthrough in high-frequency communication, playing a crucial role in enabling ultra-fast data transfer rates and AI-driven networks. Its applications include high-speed modulation and demodulation of signals for millimeter-wave (mmWave) and terahertz bands, energy-efficient components for low power consumption, and integration into smart antenna systems for dynamic beamforming and enhanced spatial coverage. Additionally, it supports massive IoT connectivity, allowing billions

of devices to operate seamlessly in a fully integrated ecosystem. With ultra-high-speed data transmission, low latency, AI-enhanced network optimisation, and massive scalability, Polymatech's 6G Telecom Die is set to drive the future of next-generation wireless communication.

Financial Growth and Global Expansion

In FY24, the company achieved an impressive 85% year-on-year revenue growth, reaching ₹1,200 crore, with net profit rising 64% to ₹275 crore. Bolstered by a robust export-driven order book, Polymatech is strategically positioned to expand production and meet the surging global demand over the next two years.

Conclusion

As India advances toward semiconductor self-reliance, collaboration with academia, government, and global industry leaders will be crucial to its success. With the right policies, strategic investments, and a skilled talent pool, the nation is poised to become a global semiconductor powerhouse.

Together, let's shape the future of semiconductors in India. The time is now. The vision is clear. The possibilities are limitless.
