

STAYING SAFE

● The implementation of robust data protection laws has become urgent ● Experts say there is an urgent need for enhanced security measures

MAPPING TRENDS

● There should be longer term plans to provide stability to electric mobility brands ● Extension of FAME subsidy remains pivotal to industry players

ment policies in promoting green tech. The EV segment remains one of the fastest-growing in the green tech sector and the government can provide greater stability to electric mobility brands by releasing a longer term plan. “Policies on battery swapping need revisiting due to rapid technological advancements. Additionally, a five-year policy road map would provide greater clarity and stability for the industry,” says Lewis.

Niraj Rajmohan, CTO and Co-founder of Bengaluru-based EV start-up Ultraviolette says, “Recent discussions surrounding the implementation of FAME III present a notable opportunity to enhance EV adoption. In light of this, any extension of the FAME subsidy and removing caps on the ex-factory prices of EVs will be pivotal.”

To keep pace with tech advancements, enhancing digital literacy

and technical skills among the workforce is crucial. This includes expanding tech-related courses and training programs in educational institutions. Jain flags the gap in this space. “The government needs to create a robust cybersecurity infrastructure to protect the most vulnerable individuals, ensuring they do not lose trust in the digital payment ecosystem,” he advises.

REACHING THE STARS

The government’s supportive policies in the spacetechnology sector will be pivotal to fostering innovation, investment, and global collaboration.

Awais Ahmed, CEO of aerospace firm Pixxel, highlights the potential of spacetechnology start-ups in India. “The amendments to the FDI policy and initiatives like Mission DefSpace will serve as catalysts for innovation and growth in the space sector,” he

says. Ahmed emphasises on the importance of new tech such as reusable launch vehicles and the use of AI in machine learning algorithms.

Cutting down on red tape, speeding up approval processes, protecting intellectual property, and promoting fair competition will be of importance to private companies that want to invest in space tech.

As the world wakes up to newer tech-related advancements, the new government will need to focus on setting new benchmarks for a tech-empowered India. A comprehensive approach that includes updates in data protection laws, continued support for domestic manufacturing, leadership in emerging technologies, and a commitment to sustainability can position India as a global leader, as tech’s the way forward. **BT**
