

Gen AI. This significant capital demand, coupled with the near-term energy transition requirements, is likely to be inflationary in the near term.

44 | Q: Your big investments are in the US. How much weight do you give to the political landscape given the likely return of [former President Donald Trump]?

A: I think with respect to politics, we have been investors in the US for 25 years, pretty much since we started. One of our fundamental investment beliefs is that we're a long-term investor. And we expect to invest through different administrations. And another thing I think is important as a long-term investor is not to have your investment thesis or investment approach completely predicated or dependent on the policies of a given government. They can be constructive. I think, like everybody else, we will watch what happens in November and continue to invest.

Q: Given the 6% exposure you have to the Chinese economy, how do you assess the current economic situation on the mainland?

A: I think with respect to China, we continue to think it's important to maintain the capabilities and the relationships to invest in the big economies around the world. So, we continue to have what we think is a prudent exposure and investment in China. Our appetite is probably not the same as it was a few years ago. The opportunity set is probably not what we thought it was going to be a few years ago. But we continue to think it's an important market for the fund and one that we continue to look at and continue to stay invested in.

Q: The government has a vision of making India a developed nation (Viksit Bharat) by 2047. Sitting in Canada, how do you see the Indian economy evolving?

A: There is a lot of enthusiasm in the market. As I look at our portfolio, which is currently about C\$28 billion invested in India, one key aspect to highlight is the diversification within that portfolio. It includes investments in energy, infrastructure, real estate, private equity, public equity, credit, and fixed income. We have got everything. This diversification reflects the breadth of the Indian economy. With India's growth rate contributing significantly to global growth, we anticipate ongoing opportunities to expand our diversified portfolio, particularly in infrastructure and both public and private assets. India is on a tremendous growth trajectory and is building out infrastructure and physical assets. For long-term, patient investors like us, this presents a great opportunity. Overall, we are very enthusiastic about continuing our investment in India. And things we'll continue to look for are continuing efforts to build up the capital markets, building deeper capital markets, and increased liquidity in the market, all of which are positive signs for the future trajectory of the market.

Q: Are you primarily interested in clean and green technologies in the energy sector?

A: Our approach to investing in energy is that we believe the world will transition to net zero over time. However, we also believe it's important to invest across the entire energy spectrum. As an investor, we continue to invest in oil and gas while also maintain-
