

tutor, and every person can access personalised medical advice,” he says, adding that India has the twin advantages of a young population and a large developer base. And with 76% of enterprises focussed on Gen AI investments and with 1.5 million engineering graduates passing out annually, the market is poised to transition from the “information revolution” to the “intelligence revolution” by skilling its workforce in AI, he adds.

Rajiv Kumar, MD of Microsoft India Development Center, agrees. “AI’s growth will evolve from basic language models to advanced ones, excelling in analytical, emotional, and action intelligence, moving India towards its goal of being an AI-first nation,” he says.

AI’s role in addressing India’s unique challenges such as urbanisation and climate change is also significant. Chandok points to initiatives like the Jugalbandi project, an AI-driven chatbot that bridges language barriers and enhances access to government services. “With over one-sixth of the global population residing in India, AI’s integration into India’s digital public infrastructure (DPI) is crucial. For this to manifest, a skilling-first approach is essential to ensure citizens can thrive in the AI-driven economy,” he explains.

Jaspreet Bindra, Founder of consulting firm Tech Whisperer, says that by 2047, India will have figured out how to provide AI to every citizen.

DIGITAL BACKBONE

Industry watchers say semiconductors will be the backbone of India’s technological and economic growth. Hitesh Garg, Vice President and India Country Manager of NXP Semiconductors, says this sector can significantly contrib-

THE AI REVOLUTION

- Artificial Intelligence can transform industries, improve governance, and make everyday life smarter
- By 2047, AI will be at the core of India’s journey to becoming a global technological leader

REVVING UP EVs

The global EV market is growing at a staggering CAGR of 21.7%

A whopping 419,000 EVs have already been sold in India in 2022. This number stood at a mere 119,000 in 2020

Battery prices remain high in India; just the lithium-ion battery for an EV costs ₹5.7 lakh

ute to India’s GDP by 2047, enabling a robust electronics system design and manufacturing ecosystem and generating annual revenue of more than \$1 trillion, while creating millions of jobs. However, building a robust ecosystem will require overcoming significant challenges. “The key challenges include a robust supply chain, adequate workforce, and infrastructure, while opportunities lie in leveraging India’s large market and government incentives,” says Garg.

Prabhu Ram, Vice President-Industry Research Group at Cyber-Media Research, believes that the semiconductor industry will be a lynchpin in India’s vision of becoming a developed nation by 2047. “Developing and manufacturing advanced chips will fuel innovation,

enhancing national competitiveness, economic growth, and security. This, in turn, has the potential to contribute to high-skilled jobs, advancement in tech skills, and position India as a key global technology hub,” he says.

SUSTAINABLE MOBILITY

The transition to EVs is another critical aspect. Maxson Lewis, Founder & CEO of electric mobility solutions company Magenta Mobility, envisions a future where “every vehicle on the road is sustainable and, hence, electric”. He predicts that by 2040, India’s EV landscape will have evolved significantly, with vehicles not only consuming electricity but also supporting the grid through Vehicle-to-Grid (V2G)
