FOUNDER, TECH
WHISPERER LTD

technology, with 25% of all vehicles having this capability.

Lewis talks about the broader ecosystem required to support the EV revolution. “The infrastructure for EVs is often mistaken as only involving charging infrastructure... [this] includes multiple components [like]... the distribution network, generation capacity, and technology around charging, as well as manufacturing capacities in India,” he says.

Pankaj Sharma, Co-founder & Director of EV battery maker Log9 Materials, shares a similar vision. “India is poised to become completely energy independent by 2047, which would entail an electric grid that would be majorly powered by renewable energy, making it the cleanest grid in the world,” he says, stressing on the need for substantial

infrastructure development in the EV space.

Gaurav Gupta, Chief Growth Officer at carmaker JSW MG Motor India, points to the company’s commitment to sustainable mobility solutions. “Our goal is for New Energy Vehicles (NEVs) to constitute significantly in our total vehicle sales by 2030, with this trend expected to continue and potentially increase by 2047,” Gupta says. He also emphasises the importance of promoting a circular economy in the sector. “Through initiatives like Project REVIVE, launched in partnership with TERI, Lohum, and BatX, we are repurposing EV batteries for use in schools and community centres, extending battery life and supporting underserved communities while promoting sustainability.”

THE ROAD AHEAD

While the future looks promising, there are several challenges. A key one is the need for significant investment in infrastructure, particularly in the semiconductor and EV sectors. “Building a robust semiconductor ecosystem requires massive investment in infrastructure, talent development, and supply chain resilience. The government’s Semiconductor Mission is a good start, but we need more policy support and industry collaboration to attract global players,” says Garg of NXP.

Sharma of Log9 echoes this. “Currently, India relies heavily on imports for lithium-ion cells and other key materials. We need to build a self-reliant supply chain to reduce our dependency on imports and make EVs more affordable and accessible,” he says.

Gupta of JSW MG Motor India highlights the need for greater collaboration. “We need strong partnerships between automotive manufacturers, technology companies, and government bodies to drive the adoption of these technologies and create a sustainable future for India,” he says.

Despite these challenges, there is a strong sense of optimism among industry leaders and experts, who believe that by 2047, India will be a global leader in AI, EVs, and semiconductors. “These technologies will not only drive economic growth but also help us address some of our most pressing challenges, from climate change to digital inclusion,” says Kumar of MSIDC. He adds that with the right investments and policy support, “we can achieve our vision of a technologically advanced, economically vibrant, and socially inclusive India”. **BT**
