

MARKET SHARE

driving and active safety features,” says Shailesh Chandra, MD of Tata Motors Passenger Vehicle and Tata Passenger Electric Mobility Ltd.

Meanwhile, Maruti Suzuki’s Suzuki Connect platform offers vehicle health monitoring, location tracking, and emergency assistance. Mahindra’s connected car technology includes remote diagnostics, tracking, and integrated infotainment options.

But if most of the top automakers are now offering connected cars to the discerning consumers, how do the companies stack up vis-à-vis each other? As per Jato Dynamics, in the connected cars segment, Maruti Suzuki is the leader, with a share of 22.42%, followed by Hyundai

(16.2%), Toyota (13.62%), Mahindra (12.66%), Tata Motors (10.02%), Kia Motors (8.51%), and MG Motors (3.96%).

As automakers race to achieve electrification targets by 2030, they are integrating more technology in line with this transition. As technology continues to advance, connected cars will become even more central to the driving experience, particularly with the growing prominence of electric vehicles and autonomous driving.

For example, JSW MG Motors India has partnered with Jio to launch the MG Jio Innovative Connectivity Platform (MG-Jio ICP) with a Home to Car feature, which will be available in its upcoming Windsor EV

and future EV models.

“Connected cars get a fantastic boost with electric vehicles because EVs set the stage for increased connectivity,” says JSW MG Motor’s Gupta.

According to automakers, V2X technology will be a key driver of the automobile industry’s future. “From the IoT space, V2X will be the next leap in a few years, creating a unified connected ecosystem where vehicles, infrastructure, and connectivity platforms interact harmoniously,” says Gupta.

V2X technology allows vehicles to communicate with each other, with infrastructure, and even with pedestrians. For example, vehicle-to-vehicle communication can help prevent collisions by warning drivers of approaching vehicles. According to a report by MarketsandMarkets, the global automotive V2X market was valued at \$0.5 billion in 2023 and is expected to reach \$9.5 billion by 2030, growing at a CAGR of 51.9%.

A key development that has happened in the auto sector is that like we have in smartphones, cars too will receive continuous software upgrades. According to Chandra, this will ensure that cars will not be limited to the features they had when initially purchased but will continue to evolve.

“The biggest trend from the mobile industry that will influence the automotive space is the software-defined vehicle. Like smartphones, cars should keep upgrading with time and this will be a key feature for cars in the future, especially now with AI playing a major role,” says Chandra. **BT**
