

gation, especially since other countries too have shown an interest in adapting the India Stack bouquet of digital services to their own conditions.

EMBRACING CHANGE

The DPI ecosystem, built on a foundation of trust, needs more robust governance frameworks that prioritise transparency and accountability.

There has been significant progress in adopting digital governance processes, says Santosh K. Misra, Partner at consultancy firm PwC. Almost all citizen and business services are offered on mature e-governance platforms, and more services are being added to this bouquet. Obtaining permits and licences has become smoother.

“Healthy competition amongst government ministries and state governments triggered by the ease of doing business and National e-Governance Service Delivery Assessment rankings is yielding good results,” he says. But the government now needs to think in terms of ease of running business.

It can incorporate disruptive innovations like Generative AI (Gen AI) to operate grievance management. This would significantly reduce costs, says Misra.

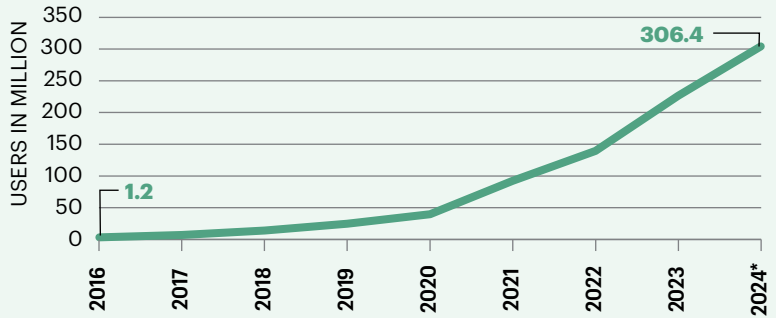

Some innovations of the government are encouraging in this regard, like DIGIT, said to be the world’s largest open source technology platform for public service delivery. These are “improving coordination for employees and vendors, simplifying administration for officials, and enhancing policy-making for [officials] and researchers”, says N. S. N. Murty, Partner and Consulting Leader, Government & Public Services, at professional services firm Deloitte India.

One area that needs immediate attention is balancing data privacy with the need for data sharing between digital public goods (DPGs). Clear standards and classification systems are needed to enable seamless exchange while safeguarding citizens’ interests.
