R.P. Gupta, CMD, Solar Energy Corporation of India

Rajiv Gupta said huge capacity addition of the non-fossil fuel power would need huge land parcels, but land acquisition remains a bone of contention keeping in mind that land is a federal issue. "We need to ramp up central and state transmission networks for efficient use of renewable power and build a robust supply chain for capacity augmentation," he said

production-linked incentive scheme, battery cell manufacturing will be local. He added that the attractiveness of investment opportunities is key to get equity in the renewable energy sector

According to Gupta, the biggest challenge in energy transition for the world is to find a solution for long-term storage. He said another big challenge is taking the lead on the technology front, as most of it is now coming from China. "We need to focus on research and development," the SECI chief said

India's dependence on China for solar supply chain remains a problem, but Sumant Sinha said with the

THROUGH THE WORLD'S EYES

Krishnamurthy Subramanian, Executive Director, International Monetary Fund

By 2047, when India celebrates its 100th year of Independence, it could become a \$55-trillion economy, said Subramanian. At the BT India@100 Summit, he said the key to this growth lies in maintaining an 8% annual growth rate in real terms, coupled with a stable 5% inflation rate. He explained that India's inflation has steadily declined from 7.5% to 5% since 2016, making it a reasonable target

Subramanian said India must continue formalising its economy, as the formal sector is more productive than the informal one. He added that the digital infrastructure being developed in the country will play a crucial role going ahead
