

EMERGING TECH TRANSFORMING INDIA

Saurabh Kumar Sahu, MD & Lead—India Business, Accenture

The nation's role as a global leader in artificial intelligence (AI) is coming into sharper focus, Sahu said. "We are already today the AI cradle of the world. A lot of significant innovation in terms of talent and new technologies are evolving here," he added

Looking to the future job market, Sahu pointed out that the true significance of responsible AI will become evident when we recognise that 60% of today's jobs were unimaginable in 1940. By 2047, emerging technologies will create roles we cannot yet conceive of, with each new job paving the way for the next. He concluded by highlighting that AI will likely become a heavily regulated industry

- **Shashank Mani**, Member of Parliament, BJP
- **Konda Vishweshwar Reddy**, Member of Parliament, TDP

In a session exploring the evolving role of legislators in shaping India's future, Karti Chidambaram pointed out that lateral entry into anything, including the bureaucracy, can be a good move, but not at the cost of reservations. "It's a good thing that the government is learning to accommodate the Opposition's voice," he said

This view was challenged by Mani, who criticised Chidambaram's perspective as outdated and argued that the current administration's [now-withdrawn] lateral entry

policy is designed to infuse new energy and expertise into the bureaucracy, which is essential for tackling the complex challenges India faces today

"Joblessness and unemployment are not just Indian problems, therefore we have to look at this issue acutely and it is not correct to say that the government has not done anything," Reddy said, noting that stability in governance is crucial for addressing social issues
