

“The world has about 2,000 GWh of [Li-ion cell] production capacity; almost 90% of that is in China... India has 1.5 GWh, that is mine [Ola’s]. I hope to set up about 100 GWh through the course of this decade”

1 billion rich people. The larger opportunity is to build for the Global South... build for India and then expand to the Global South. That’s what Ola Electric is doing with our products and now our giga factory. We’re the first giga factory in India.

With Krutrim, the opportunity and ambition is to build India’s AI tech stack. For too long in India, we have used global technologies without realising the implication. The global tech industry... is a \$30-trillion industry. We in India have been big beneficiaries

of it with the IT services boom. [But] the market cap of the IT services industry is \$300 billion, which is 1% of the global tech industry. We need to now dream to be the paradigm setters... That’s the vision with which we started Krutrim, to make India the global powerhouse.

And India has a lot of strengths and a lot of risks... The risks are fairly obvious. We use global products... WhatsApp... social media driven by western companies. All our products in the digital world are non-Indian. But the irony is, we generate 20% of the world’s data, [but] only about 10% of that is stored in India. We generate the world’s data given that we are the largest population; almost all of it is exported out of India... it’s processed in global data centres into AI, brought back into India and sold to us in dollars. If you remove the AI here, this whole thing happened 200 years ago. Colonialism... that is what is happening today.

[Among] other ironies, we have the largest developer ecosystem... the largest chip design ecosystem... but no Indian chip. Our digital ecosystem is full of ironies. That’s what Krutrim aims to change by working with the ecosystem.
