FOUNDER & FUND MANAGER, CARNELIAN  
ASSET MANAGEMENT & ADVISORS

earlier, will help increase the size of the Indian market substantially.

## SIZE, COMPOSITION

The Indian market is currently placed fourth globally in terms of market cap, and is projected to climb to the Top 2 by 2047. With India’s corporate profits expected to grow 16 times to \$2.5 trillion, Bahety anticipates India’s market valuation to expand to \$50 trillion by 2047. New regulations will likely be put in place to deal with the growing complexity and size of stock exchanges, he adds.

At present, domestic capex—government, through infrastructure development; corporations, by way of setting up new plants; and

households, by way of real estate investment—is a visible trend. Analysts believe this will also start reflecting in the indices.

In the medium term, Rajguru expects more stocks from the manufacturing or capex theme and new-age tech companies to become a part of the Sensex and Nifty as their profitability rises.

The rise of new-age tech firms could lead to an increasing number of IPOs going forward, says Nikhil Rungta, Co-Chief Investment Officer-Equity, LIC Mutual Fund Asset Management.

As is the case in today’s developed markets, by 2047, the indices may see larger representations from sectors such as green en-

ergy, consumer, technology and technology-enabled services, and digital companies, says Singhal of Quest. The economy and indices would benefit greatly from leadership in AI, blockchain and IoT.

With advanced technology, Sidana of Religare believes that investing will be more accessible. “We may see fractional ownership of everything from art to real estate, making investing more accessible.” Shoonya’s Virk adds that investment options will be more focussed on small investors as retail investments are skyrocketing.

## MARKETS IN AMRIT KAAL

The Sensex and Nifty are expected to continue their upward trajectory over the next two decades, driven by robust economic growth, rapid urbanisation and technological innovations. Vinod Nair, Head of Research at Geojit Financial Services, says, “India has started to experience better than average corporate growth in the last two to three years. This is expected to grow in the coming decades in anticipation of new reforms and an increase in private and government spending.” The Sensex has been generating a nominal return of 12-13% in the past 10 years, which can be expected to continue, he adds.

Virk believes the Sensex, in the next two decades, can zoom above 250,000, gaining over 200% from the current levels of 80,000. Sharing his view on the markets, Bahety says more wealth is made when you are in the right ship with tailwinds. “India is in the right ship. Our advice to investors is to stay in the ship patiently while avoiding short-term temptations,” he says. **BT**
