

sense of sustainability for the future. In everything we do, we recognise the importance of the intersection of planet with health and inclusive development. The systemic effects of climate change have important implications for health-care, as well as the overall aspect of livability, lives, and livelihoods.

We believe all of this needs to come together in a more synchronised way through collective action, collaborative philanthropy. We recognise that we can help build partnerships. These partnerships are important for bringing

dioxide. If we can reduce methane, we make significant progress in reducing emissions. We are trying to introduce this pilot in different parts of Asia, especially India, Indonesia, and Vietnam, where we plan to start three pilots.

We are looking for anchor partners in India who are willing to take this on, whether in funding, knowledge, or project implementation. Another project we're working on is mangrove conservation, which is crucial for carbon sequestration and capture. We also have one related to ocean conservation.

businesses. They are now focussing not just on profit, but also on impact. Many investors are considering how to use their portfolios to drive social and environmental causes and change. Similarly, philanthropists are increasingly focussing on impact and returns. Given this blurring of lines and the fact that governments may not always be able to channel funding to marginalised communities, [that is where] pilots need to come in.

We see catalytic philanthropy, done in a collaborative and collective manner, as an important

supporting lives and livelihoods, particularly in marginalised communities.

What challenges do you face when talking to people about partnerships and funding?

First of all, knowledge is fragmented, and data is not always structured. Some of the solutions we're seeing in Asia still need to be made more practicable. It's not that people aren't aware of issues like climate change or social concerns. The impediment lies in some of the issues I just mentioned. This sector is perhaps under-resourced, and talent pipelines need to be developed further.

"WE SEE CATALYTIC PHILANTHROPY, DONE IN A COLLABORATIVE AND COLLECTIVE MANNER, AS AN IMPORTANT NEW PATHWAY"

together funding resources, knowledge, expertise, and programme implementation know-how on the ground so that we can move the needle with like-minded partners.

Are your partners or alliance members exploring any pilots in India?

There are quite a few. One of them is focussed on decarbonising rice by reducing the water consumption of the crop. More importantly, there is adaptation of harvesting to reduce methane emissions by 20%. Methane, in terms of its warming potential, is much more significant than carbon

▶▶▶

How are you reaching out to various stakeholders in India?

We're exploring how philanthropy can work more closely with public sector and private capital—philanthropy as risk capital, and collaboration with corporations and governments. Many of the difficulties today are around issues related to the planet or people, and they [solutions] arise from the intersection of public policy and regulation with private capital.

The line between business and philanthropy is becoming increasingly blurred and we're working to collaborate with

new pathway forward.

▶▶▶

Are you engaging with new start-up billionnaires or communities?

Yes, most definitely. Statistics suggest that by the end of the decade, about 35% of global wealth will be with Asian millennials. This new generation... is much more interested in the impact of philanthropy than we've seen before. They want to be intentional and specific about the causes they support, seeking to understand the materiality and additionality of their efforts.

Many millennials are concerned about

How can this 'fragmented knowledge' be addressed in a diverse country like India?

Let me not speak out of turn about how India could address this, but I can share how we, at Temasek Trust, are looking to tackle this issue. I've set up what I call a Systems Knowledge and Innovation Hub, that brings together various data points and ideas, enabling us to develop a systems framework for the complex challenges we're facing today.

This can only be developed if we're able to, through such a fusion centre for knowledge, bring in information from different sources—or all sources, for that matter. **BT**
