We are playing a crucial role in India's impressive strides in renewable energy by building the world's largest renewable energy park. Just 150 km away, in Mundra, we are creating one of the world's most extensive and integrated renewable energy manufacturing ecosystems for solar and wind.

As announced by Adani Group Chairman Gautam Adani, the group is committed to achieving 45 GW of renewable energy by 2030; this will help cut annual emissions by an amount equivalent to 80 million tonnes of CO₂.

But renewables alone will not address the growing demand for electricity; storage solutions, like

pumped hydro and green hydrogen, will be required to address the intermittency of renewables and the variability of demand.

Decarbonisation is a priority for the group, with five businesses—Adani Ports and Special Economic Zone, AGEL, Adani Energy Solutions Limited, ACC and Ambuja—committed to achieving net zero by 2050 or earlier. To make green hydrogen adoption feasible, its cost must decrease drastically from the current \$3-5 per kg. Once this happens, green hydrogen and derivatives will start becoming cost-effective against fossil fuel alternatives in sectors like mobility, shipping, fertilisers, and as

green feedstock for industry and chemicals with the right regulatory support.

As we embrace clean technologies, it is crucial not to overlook the conventional sources of energy production that enable the country to ensure holistic, aspirational, and equitable growth for the vast multitude. This necessitates a careful and calibrated phasing down of thermal energy while reducing our carbon footprint and paving the way for a sustainable and eco-friendly future. **BT**
