

2. Reimagining education: At each age from 0-20 years, we have close to 20 million people. So, every year is precious to 20 million children. Our schools seem to be unaffected by the developments that are taking place in technology and Generative AI. The entire system needs a relook. We need to create a national task force for education that should include as many people from technology as from education. How do we use all the policies of social media to create an addiction to learning—gaming, competitions, engaging delivery? How might we embed the new developments into education delivery? Imagine an individualised curriculum, people learn different subjects at different levels, customised to their level of achievement. Identification of the best teachers and leveraging them more in a quality starved system, embedding training in delivery by watching and doing, making dissemination broadcasts easier and using technology for receiving these broadcasts and engaging with them. We need to reimagine education.

3. Building the healthtech stack:

Can we replicate our achievements in financial services in healthcare? Imagine the Ayushman Bharat scheme requires all policyholders to link their Aadhaar numbers to their scheme and doctors don't get reimbursed unless they have written a prescription for the patient that must be uploaded on an expanded Co-WIN-type portal. However, access to patient health records can

only be made available by explicit patient permission. This will lead to a situation where the poor will have better health records than the affluent (who currently manage their health records by memory or based on the prescriptions they retain). This will be the first step on the way to a preventive technology-enabled healthcare system.

4. Managing urbanisation better:

Some estimates suggest that India

5. Overhauling the lower judiciary:

Imagine every judgement by every sub-judicial magistrate is uploaded into a central portal that has a Generative AI program running to pick up judgements that seem suspect and get automatically reviewed. Currently, much of our population has no real access to justice. Can we embed technology to help us?

Amrit Kaal requires us to embrace technology to discover

ILLUSTRATION BY ANIRBAN GHOSH

has 400 million migrants every year. They spend the better part of every year in a nearby or distant city. We have not figured a way to handle this migration and need to do so urgently. Cities are collapsing under the weight of their expansion and are becoming unlivable due to pollution and congestion. City planning needs transformation. Can we create new industry clusters around smaller smart and planned cities?

innovations for dealing with our biggest challenges. I believe overcoming our challenges is possible and within reach as English poet Lord Alfred Tennyson says, "For I dipt into the future, far as human eye could see, Saw a vision of the world, and all the wonder that would be." **BT**
