

less as possible.

GenAI's capabilities can be extended to improve the messaging experience. An AI chatbot, for instance, can work with unique interests and personalities to cater to a diverse and ever-growing user base.

In time, we hope to put this technology in the hands of users, allowing them to use our APIs to create their own AI chatbots to use on Meta's platforms. This will

my. We're also experimenting with using GenAI to make everything from search to advertising and business messaging more effective.

The AI journey we're about to collectively embark on will be a massive leap forward. At Meta, we plan to use AI as a tool to enable us to better understand our audiences. We want this powerful new tool to anticipate behaviour and aid in content creation. If we double-click this thought, AI will also help

laboration is the first step towards achieving transparency and openness around the use of AI. Meta is a founding member of Partnership on AI, alongside Google, Amazon, Microsoft, DeepMind and IBM. We are participating in its Framework for Collective Action on Synthetic Media, an important step in ensuring guardrails are established around AI-generated content. Another important step is encouraging open innovation, which is crucial for fostering the development of AI capabilities in India, simultaneously promoting safety and innovation.

Our Purple Llama initiative helps developers build responsibly with AI models. Purple Llama underscores our commitment to developing AI ethically and with due consideration for its societal impact, ensuring that progress doesn't compromise accessibility, fairness, and privacy.

Meta's open approach to AI innovation aligns seamlessly with India's leadership on digital issues. Over the course of Meta's history, we have seen the benefits of adopting an open-source approach across different aspects of business. For instance, React, a prominent framework for creating web and mobile applications, and PyTorch, now a leading framework for AI, have become integral components of the technology industry's infrastructure—that are widely adopted and utilised.

Openness and transparency lead to better products and faster innovation; benefitting users as much as it benefits us. It is the best antidote for fears surrounding AI. **BT**

be especially useful to businesses looking to leverage our platforms to connect with customers and grow.

Combined with India's impressive array of digital public infrastructure—including the likes of the Open Network for Digital Commerce (ONDC) and UPI (Unified Payments Interface)—this could supercharge India's digital econo-

entrepreneurs launch campaigns on social media platforms and create an outsized impact so that their customers, in turn, have access to the best products in the world.

Like all foundational technologies, AI can be used for both good and bad. While we cannot eliminate all risks related to AI, we can mitigate them. Industry-wide col-
