

Q: Snapchat has managed to make a mark in India. What led to its growth here?

A: We have seen Snapchat grow historically around the world. It's always been about friends and family connecting. We know that a picture's worth a thousand words. That means you can share what you're doing and who you're with visually, through Snapchat with photos and videos. That, with all the AR lenses, is really what brings people together and helps our service grow.

To me, it's been so much fun to see a vast number of people in India using our service to connect with one another.

Q: You have been bullish about the AI story. But there are discussions around the world on what AI can do positively and otherwise. Where do you stand on the AI debate?

A: AI is such a powerful, creative tool. We all imagined in our own heads what we wanted to create

“The Snapchat community is growing and we have over 200 million users in India... I am excited about the opportunity and just seeing the way young people are expressing themselves through AR experiences”

or share. But building it or drawing it or designing it ourselves is very challenging... one can use AI to shorten the distance between what you can imagine in your mind and what you can create on your phone.
