

the Unified Logistics Interface Platform (ULIP)

- (c) And as a medium to enhance productivity through effective service delivery, e.g. Skill India and Ayushman Bharat Digital Mission

Similarly, relating to sustainability, the slew of policy initiatives have set the nation on a firm path of green growth and innovation, particularly relating to energy transition. The pathways to clean energy require new supply chains to be built, requiring deep collaboration between government, industry, research institutes, service providers and many more. Initiatives like Mission Hydrogen can unlock private capital and open up new market opportunities. Civil society can also partner in the national effort through Mission LiFE and green credit. There is also a growing realisation of the importance of adaptation and building resilience across the various sectors of the economy, especially among the most vulnerable.

Indian enterprises can play a leading role as a catalyst for leveraging the power of partnerships towards addressing the complex growth agenda. As the economic engine of society, Indian enterprises tend to be better placed to garner and allocate resources efficiently, generate a multiplier effect and reduce drags and friction across value chain partners. This proposition is best understood through some sectoral examples of significant opportunities. Inherent in these examples are various partnerships involving farmers, large enterprises, MSMEs, governments, research institutions and a range of service providers spanning testing laboratories, logistics providers, training services and many more.

India has huge potential in the agri-food sector, given its inherent strengths. While the government can contribute through policy, enterprises can invest in translating market signals into productive output and in creating capacity among farmers through inputs such as climate-smart agriculture. Such an approach will boost investment, ensure viability, and align the value chain constituents.

Similarly, a partnered approach to creating a competitive wood-based industry can generate large economic multipliers, enable significant carbon sequestration and livelihood generation. Our country has 30 million hectares of degraded forest land capable of being converted into productive and green assets. An en-

abling policy framework that would permit enterprises to lease degraded forest land will attract investment and innovation in silviculture, enhance competitiveness, spawn new wood-based industries, enable import substitution to the tune of \$4 billion annually, create large carbon sinks and generate significant rural employment of nearly 1.3 billion person-days.

Each of these opportunity areas represents a pathway to securing growth with sustainability and shared prosperity. More importantly, it will provide large-scale opportunities to productively engage a wide spectrum of skill sets besides providing significant avenues for migration of agrarian skills to adjacent, higher order livelihoods. A partnered approach can hasten the realisation of our shared national vision. This would be a worthy agenda not only for the next five years but also well beyond. **BT**

INDIAN ENTERPRISES CAN PLAY A LEADING ROLE AS A CATALYST FOR LEVERAGING THE POWER OF PARTNERSHIPS TOWARDS ADDRESSING THE COMPLEX GROWTH AGENDA

Each of these opportunity areas represents a pathway to securing growth with sustainability and shared prosperity. More importantly, it will provide large-scale opportunities to productively engage a wide spectrum of skill sets besides providing significant avenues for migration of agrarian skills to adjacent, higher order livelihoods. A partnered approach can hasten the realisation of our shared national vision. This would be a worthy agenda not only for the next five years but also well beyond. **BT**

These sectoral examples link industry with agri and wood value chains and contribute to the cause of 'manufacturing competitiveness'. Similar opportunities can be created in the services sector, which has been leading economic
